SIMPLE & INDISPENSABLE POST PROCESSING SOFTWARE

Simple and powerful post-processing software, owning many preset coordinate systems and advanced data processing algorithms to process static data and obtain reliable results quickly.

Software

Rich Preset Coordinate System

Satisfy all your coordinate system needs with many built-in coordinate systems, and customize and export your coordinate system parameters.

Standard Data Processing Reports

Know the accuracy and results of baseline and measurement differential solutions via the informative reports on Static data processing.

PPK Data and Static Data Supported

Quickly and accurately process static and PPK data, making your job easier.

Built-in Rinex Data Converter

Supports the import of different formats of base maps including, but not limited to AutoCAD formats (DXF, DWG), SHP and Land XML, which provides a more user-friendly experience during fieldwork.

Output Format Customizable

Customize the format of the output results, allowing you to output your measurements more quickly and efficiently.

Safely Stored Projects

The entire process, including baseline solution, network adjustment and other operations, can be operated in the project folder. All operations are automatically recorded.
